Central Superstore Data Warehouse

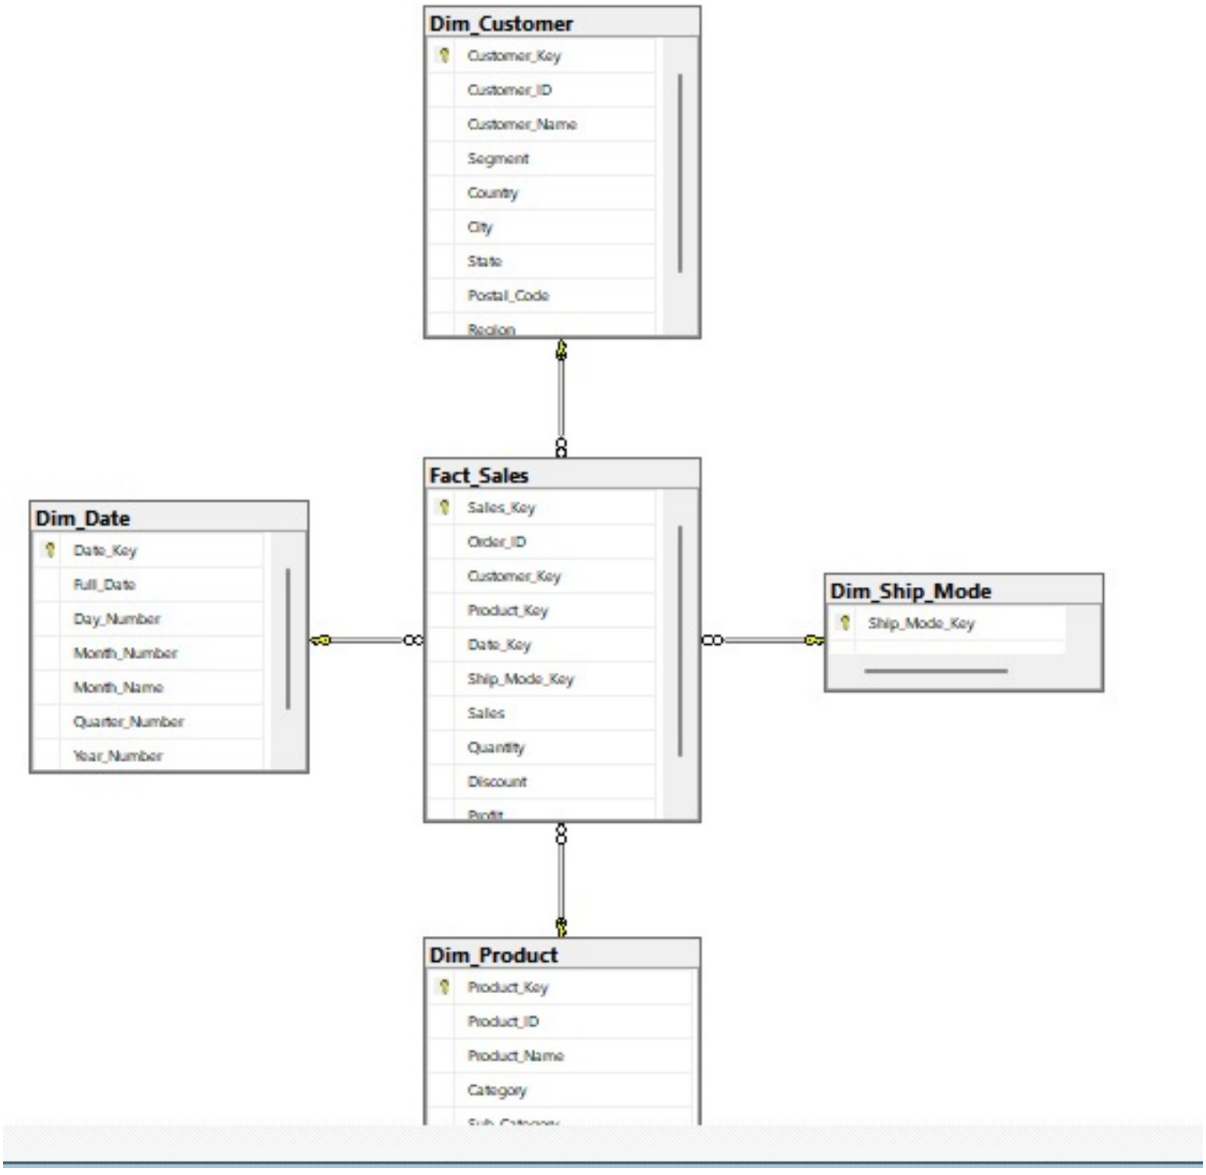

Portfolio Sample • Star Schema Design

Project Overview

This project focuses on organizing retail sales data using a dimensional data warehouse design. The schema separates measurable sales records from descriptive dimension tables to support structured reporting and analysis.

Data Warehouse Design

The diagram places **Fact_Sales** at the center and connects it to dimension tables including **Dim_Customer**, **Dim_Date**, **Dim_Product**, and **Dim_Ship_Mode**. The fact table contains sales-related fields such as Sales, Quantity, Discount, and Profit, alongside keys used to relate records to the dimensions.

Tools: SQL Server • SQL Server Management Studio (SSMS)

Portfolio note: This document presents the schema design image as a project sample. Additional implementation details and results can be added as the project progresses.
